

NBS 300 for CNC Sharpening of Band Saw Blades

The next generation of CNC sharpening machines, the NBS 300 brings the joy of sharpening process - higher quality sharpening results, operator safety and remote access support via internet - backup programs; software updates; via PC or smart phone access to machine display; remote service support; integration into the production process and gathering technological data, etc.

The machine is ideal for the sharpening of stellite, CV, bimetal and carbide-tipped band saw blades up to 300 mm wide. It operates with ceramic, CBN or diamond grinding wheels using water cooling. Driven diamond dressing wheel with automatic cycle is installed in order to keep the shape of ceramic stone clean and consistent. Thanks to this, the stable and consistent tooth shape of the sharpened blade is ensured.

The NBS 300 is equipped by transverse axis and therefore trapezoidal or alternately slanted teeth can be sharpened. Another advantage of the machine is the servo-controlled feeding finger, which ensures a faster cycle run, since it starts to feed as soon as the grinding wheel moves back.
